

Business Problem Statement:

A food delivery company wants to reduce delivery time and improve customer satisfaction by identifying the factors that cause delays. The business can analyze restaurant preparation time, distance, traffic, weather, vehicle type, delivery partner availability, and order time to predict the expected delivery time.

Goal: Build a Food Delivery Time Prediction model using Python, SQL, and Power BI to:

Predict delivery time accurately.

Identify reasons for delivery delays.

Compare delivery performance by restaurant, location, and vehicle type.

Improve customer satisfaction and delivery efficiency.

Help the company optimize delivery partners and operations.

Deliverables:

1. Data Preparation & Modeling (Python): Clean and transform the raw dataset for analysis.
2. Data Analysis (SQL): Organize the data into a structured format, simulate business transactions, and run queries to extract insights on customer segments, loyalty, and purchase drivers.
3. Visualization & Insights (Power BI): Build an interactive dashboard that highlights key patterns and trends, enabling stakeholders to make data-driven decisions.
4. Report and Presentation: Write a clear project report summarizing your key findings and business recommendations. Prepare a presentation that visually communicates insights and actionable recommendations to stakeholders.
5. GitHub Repository: Include all Python scripts, SQL queries, and dashboard files in a well-structured repository.
